Barcelona

## Casa de l'Aigua

Built in 1917, Casa de l'Aigua in Trinitat Nova is a landmark facility in the neighbourhood and an emblematic space in the city due to its historical and architectural interest and its privileged location between the Barcelona plain and Collserola mountain range.

The original complex consisted of a water elevation station in Trinitat Vella, chlorination pavilions and a tank in Trinitat Nova, and an underground tunnel that connected both facilities and extended towards Collserola. The Modernista-style complex is listed in the city heritage catalogue.

These facilities operated until 1989, and then, between 2007 and 2013, Barcelona City Council carried out work to strengthen and improve them. The building eventually opened at the start of 2015 and, since then, it has served as a meeting point for Trinitat Nova neighbourhood associations, and also offers guided tours and a programme of leisure and cultural activities largely focused on the environment, given its privileged location.
